## LOKRING installation in Eastern Europe's largest data center

More than 2.500 LOKRING solder-free tube connections installed – result: 100% SUCCESS

---

For the air-conditioning installation in the head office of the data center operator DATAPRO in Moscow the German-Russian company PROWELF made use of the LOKRING technology.

In December 2014, the construction of the largest data center in Eastern Europe was completed. For the optimal climate of the 16,000 square meter center 32 precision air conditioners were installed. They were fully assembled with the use of LOKRING connections. A total of 2,000 meters refrigerant piping was installed. The VULKAN Lokring staff accompanied and trained the staff of PROWELF in the assembly of the solder-free tube connections.

DATAPRO is the first company in Russia, which has implemented a project like this with the solder-free tube connection technology of LOKRING. And it is a great success, because the result exceeded all expectations. The completely smooth and clean installation work was carried out in record time. In addition, no fire hazard soldering work in the rooms and the roof had to be carried out.

The simplicity and reliability of solder-free assembly with LOKRING did not only convince the installation team PROWELF, but also Aleksey Soldatov, CEO of DATAPRO.

At the last meeting "DC World Forum - 2014" in Moscow, where the DATAPRO project was presented, Aleksey Soldatov thanked the companies PROWELF and VULKAN Lokring for the successful collaboration in the DATAPRO project. He pointed out that due to the clean and fast application of LOKRING products the construction of the largest data center in Eastern Europe was successfully completed in record time.

The construction of additional DATAPRO data centers is imminent in Moscow, St. Petersburg and Austria.
